State of the art

State of the art:

- Analyses carried at Belle II for Hadronic Tagged Analysis (HTA), Inclusive Tagged Analysis (ITA) and combined
- Decay channel: $B^+ o K^+
 u \bar{\nu}$
- ullet Results: evidence for 2.7σ above the SM expectation from combined analysis

Main goal

- Carry the same analysis for the Semileptonic Tagged Analysis (STA)
- \bullet Compare the results on $B^+ \to K^+ \nu \bar{\nu}$ with STA for consistency check
- ullet Will also do the analysis for one of the $B o K^*
 uar
 u$ channel

First approach

- Very similar to HTA since exclusive analysis
- Will use *semileptonic* FEI instead of hadronic
- Important variables for HTA: ΔE and M_{bc}
- \rightarrow Important variable for STA: $\cos(\theta_{BY})$

Quests

Main quests:

- 1. Take the previous workflow, understand it and automatize it using ${\tt B2LUIGI}$ (95% done)
- 2. Adapt the workflow to the STA (partly done by Jacopo)
- 3. Test the new workflow with and without the Tree Fitter

Side quests:

- 1. Switch the plots from homemade functions to PLOTHIST
- 2. Change computation of uncertainties to more standardized way \rightarrow will use SYSVAR or PYHFCORR
- 3. Check CABINETRY for management of PYHF fits

Current tasks

Active quests:

- 1. Take the previous workflow, understand it and automatize it using ${\tt B2LUIGI}$ (95% done)
- 2. Adapt the workflow to the STA (partly done by Jacopo)
 - Change the FEI corrections to semileptonic (for cross-check with respect to embedded)
 - Change the corrections to run dependent
- 3. Test the new workflow with and without the Tree Fitter
 - Try $\Upsilon(4S)$ vertex fitting with TWINB
